Projects

Pneumonia Detection Using Deep Convolutional Neural Networks (View Project) Aug. 2023 – Sep. 2023

In this study, a deep learning approach to pneumonia detection in chest X-rays was investigated. The ResNet18 architecture was employed, and training was conducted on the RSNA Pneumonia Detection dataset. An Artificial Intelligence interpretability technique was utilized to gain insights into the decision-making processes of the model.

Breast Tumor Segmentation and Shape Classification in Mammograms (View Project) Feb 2022 - Jul. 2022

In this project, a conditional Generative Adversarial Network (cGAN) was used for breast tumors segmentation in 2D mammograms, aiming to support radiologists. A CNN-based shape descriptor is proposed for classifying tumor shapes into four categories. INbreast and DDSM datasets were used to train and evaluate the model.

Brain Tumor Segmentation (View Project) May 2021 - Sep. 2021

In this project, fuzzy c-means algorithm and a classical threshold method were used to segment brain and tumor area in x-ray brain images, respectively. The output of these two methods were combined to generate the final binary mask of tumor.
